

INSTAGRAM USER ANALYTICS

Problem Statement

Nowadays, Instagram usage has increased significantly among users. However, the relationship between followers count, engagement level, and screen time is not clearly understood. It is also important to analyze whether excessive usage impacts lifestyle factors such as sleep and stress. From a business perspective, advertisement performance and premium user conversion are also important. This project aims to analyze Instagram usage, engagement, lifestyle, and business metrics using data analytics techniques.

Key Performance Indicators (KPIs)

- Total Users
- Average sleep hours
- Average Daily usage
- High usage percentage
- High Usage Users (>180 minutes)
- Average Engagement Score
- Engagement per Session
- Average Stress Score and Sleep Hours
